CYPHER · THE ESSENTIALS

The system, explained.

A complete walkthrough of what Cypher is, what's on the chart, and how to read it. Built for anyone who wants to know the system from the outside in.

00

THE ESSENTIALS

EDITION · 2026

CYPHER

WELCOME

What is Cypher?

Cypher is a price action trading system built around one idea: when the chart is ready to move, the system should tell you. Not before. Not after. On the candle it happens.

It works by reading the chart on multiple layers at once. Trend, momentum, reaction levels, and volatility are checked every second. When several of those layers agree at the same time, a clear signal prints on the screen. A green **B** for buy, or a purple **S** for sell.

You don't read indicators. You read the result. The trade is on the screen, with the entry, the stop loss, and three take profit zones already calculated for you. Your only job is to act when the conditions line up, and to wait when they don't.

WELCOME

Who is Cypher for?

Cypher was built for two kinds of trader. The one just starting out who wants the chart to make sense, and the one who already trades and wants cleaner setups with less screen time.

01 · NEW TRADERS

Take the guesswork out

Every part of the system is colour coded and labelled, so you can see what the market is doing without learning to interpret a dozen different indicators.

Green means up. Purple means down. A letter on the candle means it's time. Learn the five reads on the chart and you can follow along from day one.

02 · EXPERIENCED TRADERS

Sharper entries, less screen time

If you already trade, Cypher slots into your existing process as a confirmation layer. Use it to filter setups, time entries more precisely, or read multi timeframe context at a glance.

It frees you up to focus on the trades that matter and skip the ones that don't.

WELCOME

When can you use it?

Cypher reads the market in real time and adapts to whatever state it's in. Whether price is trending, going sideways, or pulling back inside a trend, the system shows you the right kind of trade to look for.

REGIME 01

Trending

When price is moving in one direction with momentum behind it, Cypher highlights pullbacks and continuation entries that let you join the trend at the cleanest moments instead of chasing.

REGIME 02

Ranging

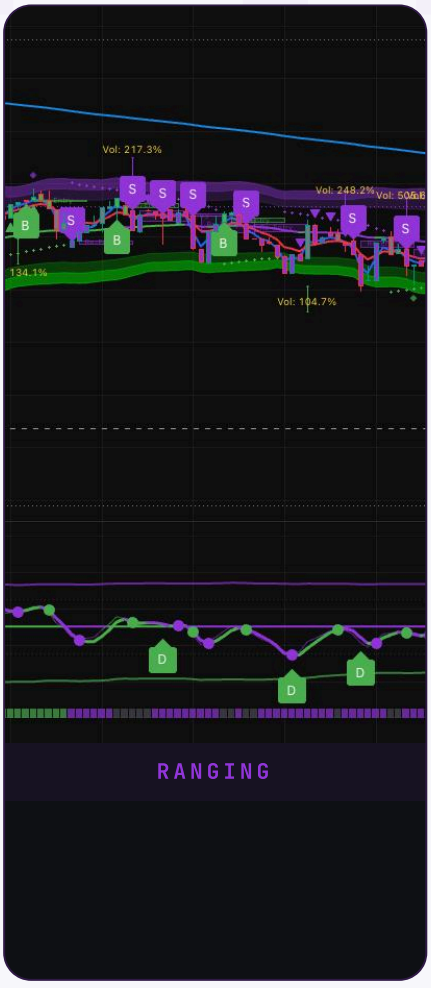

When price is consolidating between two levels, Cypher marks the top and bottom of the range with reversal zones, so you can fade the edges rather than guess.

REGIME 03

Pulling back

The cleanest setups happen when a strong trend retraces into the system's inner band. Cypher catches these moments and flags the re entry.

WELCOME

What markets can you trade?

Cypher works across every major asset class. The system automatically adapts its reaction levels, ranges, and confirmations to the kind of market you load. You don't change settings between gold and indices, or between forex and crypto. One indicator, every market.

Forex

Currency pairs, majors, crosses, and emerging market pairs. The system handles low priced pairs and high priced pairs alike.

Gold & metals

Spot gold, silver, and other metals get their own tuning so the reversal zones and reaction levels read true for higher priced assets.

Stock indices

The S&P, Nasdaq, Dow, FTSE, DAX, and other major indices. Wider reaction levels suit how indices actually move.

Crypto

Bitcoin, Ethereum, and the large cap altcoins. Cypher applies the same wide reaction levels used for indices to handle crypto volatility.

Individual stocks

Cypher also works on single name stocks and ETFs. It uses the forex tuning by default for these, which suits most equity price ranges.

WELCOME

What trading styles work best?

Cypher is fully optimized for any trading style, whether you're in and out quickly or holding positions for days. The same five reads on the chart apply across all of them. You pick the style that suits your schedule and personality.

STYLE 01

Scalping

For traders who want quick moves and short hold times.

Cypher reads the short timeframes the same way as the long ones. The reaction levels are tighter, the signals print more often, but the routine is identical.

STYLE 02

Day trading

Perfect for steady setups across a single trading session.

The sweet spot for most traders. Signals are clean, levels read naturally, and the system has time to confirm before firing. One sitting, a handful of setups.

STYLE 03

Swing Trades

For traders who prefer bigger picture moves and longer holds.

Fewer trades, larger ranges. The reaction levels are wider and the signals carry more weight. The same five steps still apply, just on a slower clock.

WELCOME

How does it help you trade?

Cypher uses a built in scoring system, dynamic support and resistance tools, trend detection, and real time signals to simplify your analysis so you can focus on making better decisions. The system does the heavy lifting and gives you visual, colour coded guidance every step of the way.

The Flag

The signal that prints when conditions align. B for buy, S for sell. The cleanest trigger Cypher produces.

Trend Table

Instantly spot trend direction across every timeframe at once. One glance, one read, no scrolling.

Reaction Levels

Support and resistance zones are drawn for you in real time, with colour coding so you know which side is which.

Bar Colour

Candle outlines tell you the market's underlying flow, so even when no signal is firing, you know which way the wind is blowing.

The Pulse Line

A momentum oscillator in its own pane that confirms setups before the Flag prints, so you're ready before the signal lands.

Real Time Divergence

Cypher spots divergence as it forms and labels it on the chart with a clear D, so you can catch reversals as they happen.

PART TWO

The system, component by component.

Six things on your chart, plus one signal that ties them together. Each one has a job. Each one is colour coded. Together they form the Cypher read.

02

THE SYSTEM

PAGES 09 TO 15

COMPONENT 01

The Flag.

The Flag is Cypher's main trade trigger. It's the moment all the other components agree at the same time. When that happens, a single letter prints under the candle. A green B for buy, a purple S for sell.

B

Buy Flag

The chart agrees on long. Time to look for an entry.

S

Sell Flag

The chart agrees on short. Time to look for an entry.

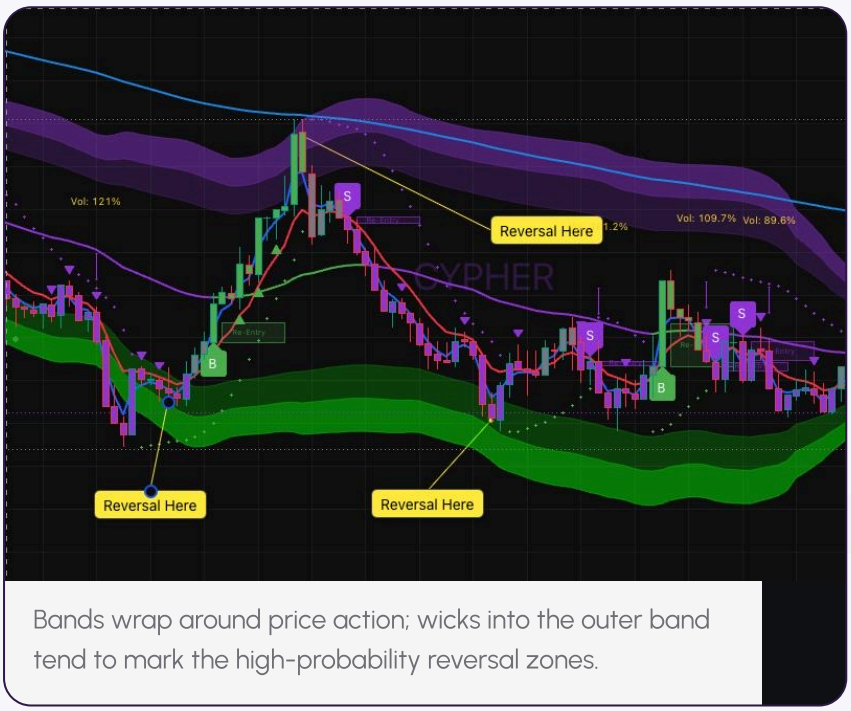

Behind the scenes, the Flag waits for several conditions to line up on the same candle. Price interacting with a reaction zone, the underlying flow colour confirming, the Pulse Line agreeing, and a fresh momentum trigger all firing together. You don't have to track any of that, you just have to wait for the letter.

The system also includes a built in cooldown so the Flag doesn't keep printing back to back letters in the same direction during one big move. Once a B has printed, you won't see another B for several candles. The same for S. This stops you taking the same setup three times in a row.

COMPONENT 02

The Reversal Bands.

Cypher features a proprietary reversal band system designed to anticipate where price is most likely to turn. These bands act as adaptive zones of support and resistance that move with volatility, helping you spot high probability reversal points in real time.

Bands wrap around price action; wicks into the outer band tend to mark the high-probability reversal zones.

What you see

- **Inner band**: the first level of dynamic support and resistance, where pullbacks tend to end.
- **Outer band**: the high probability reversal zone, where major shifts in direction are most likely.
- **Colour fills**: the space between bands is tinted green or purple so you can tell where you are at a glance.

Cypher's main signal, the Flag, only fires when price interacts with these bands and the rest of the system agrees. This is what gives every Cypher entry its high probability character.

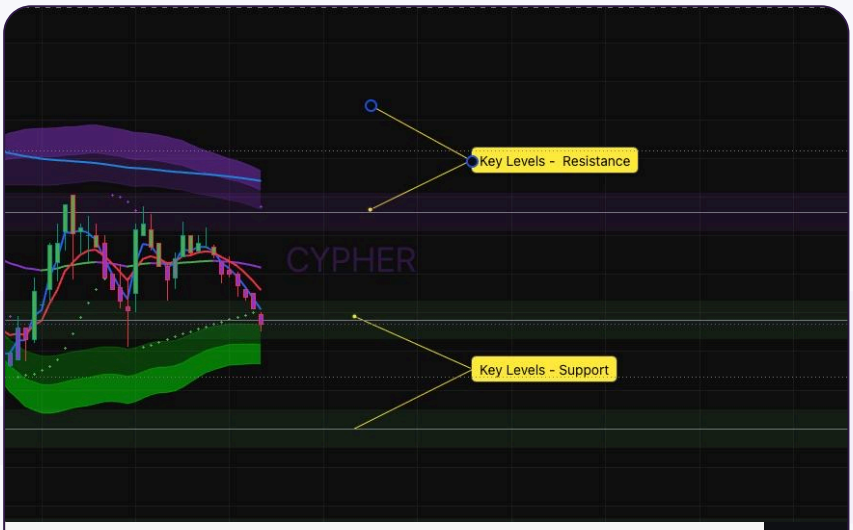

COMPONENT 03

The Key Levels.

Cypher draws institutional style psychological levels on every chart. These are the round number prices that the big players reference for orders, and they form dynamic zones of support and resistance you can anticipate well in advance.

What you see

- **Red zones above price** act as resistance.
- **Blue zones below price** act as support.
- **Gray horizontal lines** mark the levels themselves, with the coloured glow showing which side they sit relative to current price.

Horizontal levels stretch across price with red glow above and blue glow below — quick visual read of which side is resistance vs support.

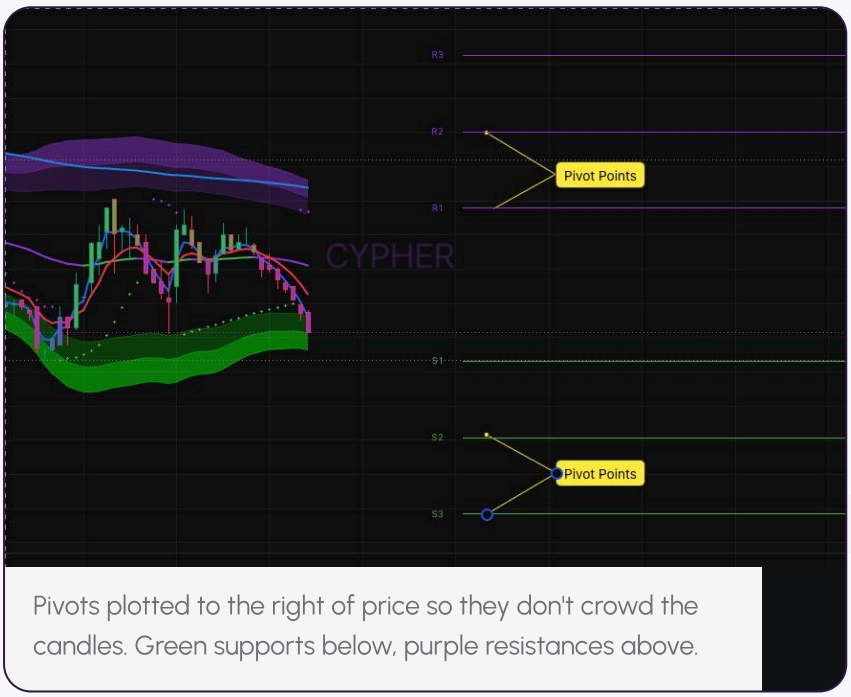

The spacing between levels adjusts automatically to your timeframe and to the asset you're trading. Lower timeframes and gold get tighter levels. Higher timeframes and wider markets like indices and crypto get wider levels.

Used alongside the reversal bands, key levels give you extra confidence that a setup is happening at a meaningful spot rather than mid range. When a band touch lines up with a key level, the probability of a clean reaction goes up.

COMPONENT 04

The Pivots.

Cypher includes a set of pivot points calculated from the previous session's price action. These are well known reaction zones that professional traders watch, and they slot into the system as a third layer of support and resistance.

Pivots plotted to the right of price so they don't crowd the candles. Green supports below, purple resistances above.

What you see

- **Green lines below price** are the support pivots.
- **Purple lines above price** are the resistance pivots.
- **Inner pivots** close to current price act as reversal targets. **Outer pivots** are extreme zones for stretch moves.

Pivots come into their own when they line up with a reversal band touch and a key level. That triple confluence is one of the strongest reads Cypher produces. On higher timeframes the pivots use weekly data, so they show macro level reversal zones for longer term setups.

Fair Value Gaps (30m)

On the 30 minute, Cypher draws Fair Value Gaps as translucent boxes. A Fair Value Gap is an imbalance left behind when price moves so fast it creates a 'gap' either side of the middle candle in a 3-consecutive-candle pattern. Markets almost always come back to fill these gaps, so an unfilled FVG becomes an additional target area. Treat the far edge of the box as a take-profit zone, or wait for price to fill the box before looking for the next setup in the original direction.

COMPONENT 05

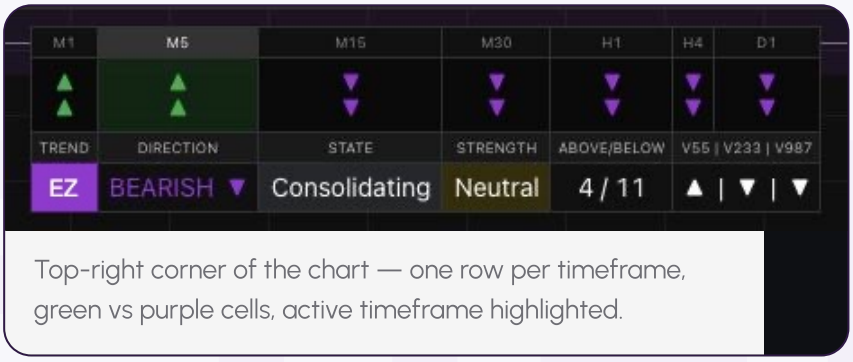

The Trend Table.

The Trend Table sits in the top right corner of your chart. It reads the market for you on multiple timeframes at the same time, so you can see in one glance which way each layer of the market is pointing.

What you see

- **One row per timeframe.**
- **Stacked from shortest at the left to longest at the right.**
- **Green cells** mean that timeframe is bullish. **Purple cells** mean bearish.
- **The current trading timeframe** is highlighted so you always know where you sit in the stack.

The single most useful read is your trading timeframe matched against the one above it. When both agree, you have the wind behind you. When they disagree, you stand down or wait for them to align.

Top-right corner of the chart — one row per timeframe, green vs purple cells, active timeframe highlighted.

COMPONENT 06

The Pulse Line.

The Pulse Line lives in its own pane below the chart. Think of it as a heart monitor for the market. It tracks momentum in real time and gives you several clear visual cues that something is changing before price catches up.

CUE 01

Pulse Line crosses the secondary signal

When the Pulse Line crosses the secondary trade signal line, a large dot prints on the cross. That's the system flagging an early momentum handover — one of the strongest pre-Flag cues.

CUE 02

Reaching the outer bands

The pane has its own coloured bands that mark exhaustion zones. When the Pulse Line reaches the outer bands and curls back, a reversal is brewing.

CUE 03

The "D" divergence label

When the Pulse Line moves in the opposite direction to price, a D prints on the screen. This is the single strongest reversal cue Cypher produces.

CUE 04

Bar colour at the bottom

A row of coloured bars at the bottom of the pane shows underlying trend bias from several confirmation tools running in sync. Green for bullish, purple for bearish, gray for mixed.

THE ESSENTIALS CYPHE

The oscillator pane — Pulse Line with outer bands, secondary-signal cross dot, divergence "D"

COMPONENT 07

Bar colour & arrows.

Three smaller features sit on top of your candles and quietly do a lot of the heavy lifting. Together they tell you the underlying market flow and highlight quick entry opportunities between the bigger Flag signals.

FEATURE 01

Bar colour

Every candle outline is colour coded by Cypher's underlying read. Green means bullish flow. Purple means bearish. Gray means mixed or waiting.

FEATURE 02

Sniper Arrows

Small coloured arrows above or below the candle for quick continuation entries inside a strong trend. Useful for adding to winning trades or taking pullback re entries.

FEATURE 03

Break Arrows

Larger arrows that print when price breaks a recent swing with confirmed volume behind it. The strongest continuation cue Cypher produces, with a volume percentage labelled next to each arrow.

Bar colour is on every chart by default and is one of the four conditions that has to align before the main Flag signal can fire. The arrows are tactical add ons used by more active traders, but every Cypher user benefits from reading the candle colour for context.

PART THREE

Wait for the Flag.

Every Cypher trade comes down to one moment. The Flag prints, the chart agrees, and the system tells you it's time. Three setups, five rules, one routine — all of it built around getting you ready for that single letter under the candle.

03

TRADING THE SYSTEM

THE SETUPS

Three kinds of Cypher trade.

Almost every trade you take with Cypher will be one of three types. Knowing which one you're in tells you what to confirm and what to ignore. The five rules that follow apply to all three. The only thing that changes is the kind of setup.

SETUP 01

The Range

For consolidating markets.

Price is moving sideways between a top and a bottom. You trade the bounces off each side of the range, fading the extremes.

SETUP 02

The Trend

For trending markets.

Price is moving in one direction. You wait for a pullback to the inner band, then enter on the continuation when the Flag fires.

SETUP 03

The Reversal

For shifting markets.

Price has run into a major reversal band and momentum is exhausted. You catch the turn as the Flag fires in the opposite direction.

As you get more familiar with the system, you'll naturally spot which setup is in front of you within seconds of opening the chart. The reversal bands and the Trend Table do most of that work for you.

THE ROUTINE

Five rules. Every trade.

No matter which of the three setups you're trading, the rules are always the same. Run through them in order. If a rule fails, you don't take the trade. If they all pass, you take it.

01 Setup
Identify which of the three Cypher setups you're looking at. Range, trend, or reversal.

02 The Flag
Wait for the letter. No B or S, no trade. This is the moment the system is telling you all the pieces line up.

03 Pulse Line
Confirm the oscillator agrees. Pulse Line direction, a secondary-signal cross, or a fresh divergence label.

04 Zone
Confirm price is at a meaningful zone. A reversal band touch, a key level, a pivot, or an unfilled FVG on the 30m. Ideally two of the four lining up.

05 Risk to Reward
Read the entry, stop, and take profit zones on the chart. Place the trade with proper risk to reward, then manage to plan.

RULE 01

Setup.

First, identify which kind of trade is in front of you. The reversal bands and the Trend Table together tell you which of the three setups applies. Pick the one that fits the chart.

CONDITION 01

Is the market ranging?

If price is moving sideways between two clear levels, you're in a range setup. Look for bounces between the top and bottom of the range.

CONDITION 02

Is the market trending?

If the Trend Table is mostly one colour and price is moving in that direction, you're in a trend setup. Wait for pullbacks rather than chase.

CONDITION 03

Is price at a major extreme?

If price has run hard into an outer reversal band and momentum is fading, you're in a reversal setup. Get ready for the turn.

CONDITION 04

No clear setup?

If none of the three apply, you stand down. The best trade Cypher can give you sometimes is no trade. Wait for the next opportunity.

RULE 02

The Flag.

With a setup in mind, wait for the Flag. No letter, no trade. This is the discipline rule that keeps you out of half-formed setups and anchors every other check to a fired signal.

CONDITION 01

B for buy

A green B prints under the candle when all the system's bullish checks align on the same bar. This is your buy trigger.

CONDITION 02

S for sell

A purple S prints under the candle when all the bearish checks align. This is your sell trigger.

CONDITION 03

The Bar colour matches

The Flag's candle should also have the matching colour outline. Green outline for a B, purple outline for an S. If they don't match, treat the Flag with caution.

CONDITION 04

Sniper Arrow agrees

For extra confirmation, look for a Sniper Arrow on the same candle or just before it. When the arrow and the Flag agree, the setup is textbook.

RULE 03

Pulse Line.

Before the Flag fires, check the Pulse Line for confirmation that momentum is on your side. The oscillator is your early warning system. Several visual cues here add weight to the upcoming signal.

CONDITION 01

Direction

Is the Pulse Line pointing the same way as the trade you want to take? Up for buys, down for sells. This is the basic check.

CONDITION 02

Secondary signal cross

Has the Pulse Line just crossed the secondary trade signal line in your direction? Look for the large dot on the cross — that's the strongest momentum handover the oscillator prints.

CONDITION 03

Divergence label

Has a green or red D recently printed in the oscillator pane? Divergence is the strongest reversal cue and adds major weight to a turn trade.

CONDITION 04

Bar colour at the bottom

The strip of coloured bars at the bottom of the pane should match your trade direction. If they don't, momentum is split.

RULE 04

Zone.

With the Flag fired and the Pulse Line confirming, the last check before risk is the zone. The stronger the zone, the higher probability the trade. Look for several of these lining up at the same spot.

CONDITION 01

Reversal band

Price is touching either the inner or outer reversal band, depending on whether you're looking for a continuation or a reversal.

CONDITION 02

Key level

A psychological key level is sitting right at the zone. This adds a second layer of support or resistance to the band.

CONDITION 03

Pivot point

A pivot point line is also at the zone. When the band, the key level, and the pivot all agree, this is triple confluence.

Two out of three is fine. Three out of three is excellent. Just one, and you should be cautious unless the rest of the system is screaming at you. Mid range entries with no zone confirmation are where most losing trades come from.

RULE 05

Risk to reward.

The Flag has fired. The trade is on. The moment it prints, five labels appear on the right edge of your chart with the exact prices for your entry, stop, and three take profits. You don't calculate. You read.

CONDITION 01

Entry

The system gives you the entry price right next to the Flag candle. Place a market order or wait for a small pullback into the entry zone for a tighter stop.

CONDITION 02

Stop loss

The SL sits **half the Flag candle's range** (H – L)/2 from entry. If price closes through this line, the read is invalidated and you exit.

CONDITION 03

Three take profits

Equal-spaced at **1R** intervals. TP1 sits 1× the SL distance from entry, TP2 at 2×, TP3 at 3×. Same on every market — forex, indices, crypto, commodities.

CONDITION 04

Partial profits

The standard practice is to take half off at TP1, a quarter at TP2, and trail the rest to TP3. If the bar colour flips against you before TP2, take the rest off at market.

THANK YOU

That's the whole system.

Six components, one signal, five rules. Take your time, revisit this guide when you need to, and let the system do the heavy lifting. Trade smarter, not harder.
